6 API STANDARD 2000 3.2.5.8 Change in Temperature of the Input Stream to a Tank A change in the temperature of the input stream to a tank, brought about by a loss of cooling or an increase in heat input, can cause overpressure in the tank. A lower-temperature inlet stream can result in vapor condensation and contraction, which can cause vacuum.

The provisions in API 2000 for normal venting depend on the product ' s flash point and temperature. The flash point of a liquid is the minimum temperature at which the liquid generates sufficient vapors to form an ignitable mixture with air, and thus is a measure of combustibility.

As per API 2000, the inbreathing flow should be sized to correspond to the maximum liquid movement out of the tank. The air ingress requirement is 5.6 SCFH (Standard ft<sup>3</sup> /h) of air for each 42 US gallon barrel or 0.94 Nm<sup>3</sup> /h of air for each m<sup>3</sup>/hr of maximum liquid emptying rate out of the tank, at any flash point.
