The Novartis Foundation Series is a popular collection of the proceedings from Novartis Foundation Symposia, in which groups

of leading scientists from a range of topics across biology, chemistry and medicine assembled to present papers and discuss results. The Novartis Foundation, originally known as the Ciba Foundation, is well known to scientists and clinicians around the world.

Originally published in 1974, this is a detailed study of the financial administration of the Chinese government during the Ming dynasty (1368-1644), with particular attention to the sixteenth century, a topic about which very little has been published either in Chinese or any Western language. Professor Huang has worked through an enormous quantity and variety of source material - in particular the 133 substantial volumes of the Ming Veritable Records - and has

compared the documents on financial matters with the entries in local gazetteers. The complicated workings of government finance present great difficulties to all specialists in Chinese financial and administrative history and in different branches of local Chinese history from the fifteenth century onwards. Professor Huang's study will provide all such researchers with an authoritative work of reference.

Water Management Challenges in Global Change contains the proceedings of the 9th Computing and Control for the Water Industry (CCWI2007) and the Sustainable Urban Water Management (SUWM2007) conferences. The rationale behind these conferences is to improve the management of urban water systems through the development of computerbased methods. Issues

such as economic globalisation, climate changes and water shortages call for a new approach to water systems management, which addresses the relevant technical, social and economic aspects. This collection represents the views of academic and industrial experts from a number of countries, who provide technical solutions to current water management problems and present a vision for addressing the global questions. The themes underlying many of the contributions include energy and material savings, water savings and the integration of different aspects of water management. The papers are grouped into three themes covering water distribution systems, sustainable urban water management and modelling of wastewater treatment plants. The water distribution topics cover asset and information management, planning, monitoring and control, hydraulic modelling of steady state and transients, water

quality and treatment, demand and leakage management, optimisation, design and decision support systems, as well as reliability and security of water distribution systems. The sustainable urban water management topics include urban drainage systems, water reuse, social aspects of water management and also selected facets of water resources and irrigation. Computer control of wastewater treatment plants has been seen as less advanced than that of clean water systems. To address this imbalance, this book presents a number of modelling techniques developed specifically for these plants. *Water Management Challenges in Global Change* will prove to be invaluable to water and environmental engineering researchers and academics; managers, engineers and planners; and postgraduate students.
