A specific machine tool is required for taking care of each machining operation. Types of Machining Tools. Machining is categorized into the types of machining tools explained in detail: Drilling. In drilling process holes are created in the metal through circular cylinders. A twist drill is used for accomplishing this task. 75% of the metal cutting material is removed through the drilling operation.

Hundreds of varieties of metal machine tools, ranging in size from small machines mounted on workbenches to huge production machines weighing several hundred tons, are used in modern industry. They retain the basic characteristics of their 19th- and early 20th-century ancestors and are still classed as one of the following: (1) turning machines (lathes and boring mills), (2) shapers and planers, (3) drilling machines, (4) milling machines, (5) grinding machines, (6) power saws, and (7) presses.

A machining process start with holding cutting tools on proper holder, position the cutting tools relative to the work, and provide power for the machining process at the proper speed, feed, and depth of cut. Machine Tools (Mill, Lathe, etc.) cause the motion of the work-part and the cutting tool that leads to the cutting of the work- part.

Machine tools that form parts by removing metal chips from a workpiece include lathes, shapers and planers, drilling machines, milling machines, grinders, and power saws. The cold forming of metal parts, such as cooking utensils, automobile bodies, and similar items, is done on punch presses, while the hot forming of white-hot blanks into appropriately shaped dies is done on forging presses.

A machine tool is a machine for handling or machining metal or other rigid materials, usually by cutting, boring, grinding, shearing, or other forms of deformation. Machine tools employ some sort of tool that does the cutting or shaping. All machine tools have some means of constraining the workpiece and provide a guided movement of the parts of the machine. Thus the relative movement between the workpiece and the cutting tool is controlled or constrained by the machine to at least some extent,
