Rosin, also called resin acid or colophony, is a natural occurring resin derived from pine and spruce trees. Unlike carbon resins, rosin is not a polymer but a complex mixture of high MW acidic molecules including abietic and pimaric type acids (see below). They are important (oligomeric) additives for plastics, rubbers

Rosin, or colophony, is a natural, abundant, cheap and non-toxic raw material which can be easily modified to obtain numerous useful products, which makes it an excellent subject of innovative research, attracting growing interest in recent years. The last extensive review in this research area was published in 2008, so the current article contains the most promising, repeatable achievements in synthesis of rosin-derived chemicals, published in scientific literature from 2008 to 2018.

Advances in Rosin-Based Chemicals: The Latest Recipes ...

Rosin-based resins and monomers are compounds which contain epoxy, acrylic, allyl, hydroxyl or oxazine reactive groups, that enable cross-linking, polymerization or building in the polymer matrix. Their preparations are usually well described and easy to perform.

Rosin is the nonvolatile solid form of resin and produced by heating fresh liquid resin to vaporize the volatile liquid terpene components. Rosin consists primarily of abietic and pimaric type resin acids (or rosin acids) with characteristic hydrophenanthrene structures and about 10% neutral materials.

Progress in Renewable Polymers from Natural Terpenes ...

Rosin can be modified via addition and esterification reactions based on conjugated double bonds and carboxyl groups. The obtained rosin-based products can be introduced into polymer chains as skeletons (Li et al., 2020). Thus, rosin may be used to produce green, efficient, and environment-friendly adsorbents for sugarcane juice decolorization.
